

Recent Project Evolution

1992

- > Further Studies of Tren Urbano Phase I
 - Alignment/Station Locations
 - → Financial/Economic Studies
 - ← Intermodal Integration
 - → Plan & Profile
- ➤ Public Awareness & Support for the System

Recent Project Evolution (1990-1993)

1993

- ➤ Under Tren Urbano Office Direction
 - Further Alignment Refinement & Evaluation
 - Río Pledras subway alignment: to bring rall service closer to the center of the UPR/business district
 - Bayamón & Hato Rey segments also revised
 - → Additional Yard & Station Location Studies
 - → Revisions to Plan & Profile

Creation of Tren Urbano Office

- ➤ Analysis of Proposed Alignment
- ➤ Analysis of Station Location, Design, and Operation
- ➤ Provide Urban Policy/Perspective
- Promote socio-economic development, quality of urban life and related public policy.

Tren Urbano Capacity Characteristics

- ➤ 180 passengers/vehicle
- ➤ 4 vehicles/train (expandable to 6)
- > headway: 2 minutes (30 trains/hour)
- > 10,800 passengers/track/hour
- > train length: 260 feet (four vehicles)
- ➤ capital cost (\$25 million/km)
- ➤ 140,000 passengers/day in 2010 assuming extensions to Carolina

Conclusions

- An integrated, coordinated mass transportation system with a rail transit component is a must for SJ Region's social and economic success and the quality of life of its habitants.
- ➤ The proposed alignment is an acceptable compromise taking into consideration the technical, social, and political impacts.

Conclusions

- Technical, environmental, and social aspects which are not clear and need further refinement
 - Natural Resources Impacts
 - -Public Parks/Recreational Facilities
 - **→** Displacements
 - → Noise, Vibration, Aesthetics
 - Future Development Potential
 - → Utility Disruption

Recommendations

- > Strong active participation of the community is essential for proper definition and success of the system.
- ➤ Marketing of the immediate and future benefits of Tren Urbano to all levels is critical.

Recommendations

- > Assess role of the Público system and establish realistic performance goals
- > Emphasize intermodal/pedestrian accessibility & ease of transfer
- ➤ Establish parking policies to discourage auto usage in adjacent areas served by the system
- > Fare structure must be carefully evaluated.
- > Planning should keep sight of the long range perspective (50 years or more).

cknowledgments

- ➤ University of Puerto Rico-Mayagüez
- ➤ Department of Transportation and Public Works
- > Highway and Transportation Authority

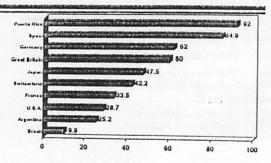

Conclusions

- ➤ Most important alignment selection criteria:
 - Availability of Right of Way
 - → Concensus among all political parties
 - Accept by faith that previous alignment studies are still the most cost-effective in a life cycle cost analysis
 - → Start by stages
 - Its now or never!

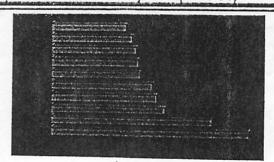

ehicles/Kilometer of Highway

Density in Urbanized Areas (person/acre)

without rail transit system (1988-90)

Major Transportation. Studies: Rail Transit for San Juan

- >1964-1967: Wilbur Smith & Associates/Padilla & Associates
- > 1979: Consultores Técnicos Asociados/Alan M. Voorhees & **Associates**
- > 1990-1993: Barton-Aschman Associates/Parsons-DeLeuw

Wilbur Smith & Associates (1967)

Renort Highlights

- ➤ Planning Horizon:1985
- ¥ Population: 1.75 million
- ➤ Car ownership: 1 per household
- > Four land-use alternatives
 - Sprawl
 - -Strong Center Santurce
 - -Strong Center Hato Rey
 - Multi-Center
- ➤ Product: SJMA Regional Plan

Vilbur Smith & Associates (1967)

Recommended Plan (transit)

- ➤ Two rapid transit routes
 - ⇒crossing in Hato Rey to reinforce it as the Regional Core
 - 1/4 area being served
 - ⇒2/3 future employment
 - → 1/3 future population
 - multi-center service
- ➤ Extensive Bus System, complemented by Publicos

Wilbur Smith & Associates (1967)

Rapid Transit System

- ➤ Routes
 - → Old San Juan-Cupey Alto
 - Bayamón-Carolina
- ➤ Length: 27.07 miles
- ➤ No. Stations: 36
- ➤ Avg. station spacing: 0.752 mi (3,970 ft.)

CTA/ Alan M. Vorhees (1979) Study Objective

- > Identify locally preferred (best) alternative among:
 - Rapid rail system alternatives & different alignment locations
 - → Light rail or express bus technologies : .
 - Low capital alternatives based on TSM (i.e., traffic engineering, land use regulations, etc.)

CTA/Alan M. Vorhees (1979)

Report Highlights

- > Population density and urban structure make San Juan rail system the most justified in the U.S.
- > There does not appear to be a reasonable alternative to rapid transit as a central element of the Regional Plan.
- > Total capital and operating cost is in the order of \$0.10 to \$0.13/public transit passenger mile; lowest in the US

CTA/Alan M. Vorhees (1979) Report Highlights

- No full system is likely to be built as a single project.
 - → Funding limitations require that implementation be conducted in stages.
- > Initial alignment recommended (inverted C)
 - Rapid rail technology, feeder service, and TSM projects (busways and priority lanes) for buses

Barton-Aschman/PDI (1993) Report Highlights

- > Dramatic improvements in the bus or público systems, or in highways by themselves, will not effectively serve the projected 45% increase in traffic volumes by 2010.
- ➤ Supports the general alignment of the first phase as defined in 1979.

Independent Studies

Multisystems (1993)

- > Findings
 - No fundamental flaws in Barton-Aschman/PDI studies
- ➤ Recommendations
 - → New financing strategles
 - → Further alignment and station evaluation
 - Developed more detailed mass transportation plan with emphasis on effective coordination and integration

Decision-making vs. Implementation

- ➤ An alternative may be
 - technologically & environmentally feasible
 - economically efficient
 - cost-effective
- > but may not be implemented due to
 - high initial investment costs
 - unavailability of financial resources at critical time periods
 - convincing all parties of the definition of benefits not quantifiable in dollar terms

Impact of Delaying Rail Rapid Transit Implementation

- ➤ Full Rail Rapid System: (27 miles; 36 stations)
 - **1967: \$231,837,000**
 - **1969: \$380,640,000**
 - 1975: \$ 1 billion
- ➤ Tren Urbano (LRT)-Phase I (12.1 miles; 18 stations)
 - 1994: \$1 billion

Recent Project Evolution (1990-1993)

1991

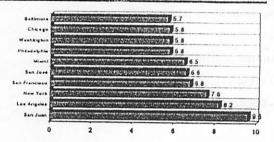

- "Metroliviano" of San Juan: Preliminary Alignment
 - → Cost estimates of 20 feasible LRT routes
 - Site visits included

 Continue

 Continue

 ■
 - ➤ Confirms 1979 "inverted C" alignment
- ➤ Cost Estimates Preliminary Alignment for "Tren Urbano" (PDI)

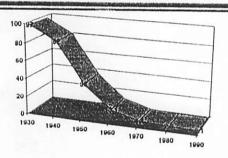

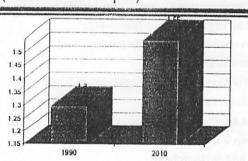

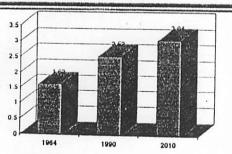

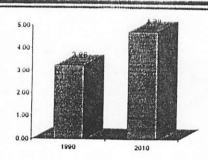

Regional Population Forecasts (Millions of People)

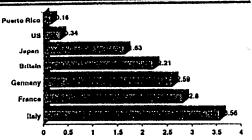

Growth in Daily Person -Trips/Capita

Regional Travel Forecast (million person-trips)

- > Motor vehicles registered
 - → 1,650,000
- ➤ Annual registration fees
 - -\$15/vehicle
 - → \$24.8 million/year

- ➤ Federal Highway Apportionments
 - →\$300 million (Certificates of Participation)
- ➤ Commonwealth
 - → \$60 million Highway Trust Fund (legislation)
- ➤ Gasoline tax
 - → 1998 & 2003: 2.5 cents/gallon
- ➤ Section 3 Bus Discretionary Funds
 - →\$32 million (Metrobús)

TABLE 3
CRITERIA USED TO EVALUATE MAJOR TRANSIT INVESTMENTS—FEDERAL TRANSIT ADMINISTRATION

| G | eneral Category | TRANSIT INVESTMENTS — FEDERAL TRANSIT A Criteria ¹ | Measures |
|----------|-----------------------------------|---|--|
| 1. | Transportation System Performance | Highway Congestion | Change in level of service, V/C ratio Change in VMT Change in hours of delay |
| | | Parking Transit Service improvements | Change in number of CBD spaces required Population with reduced/increased travel time Passenger miles on reserved right-of-way |
| ว | Mobilion | Ridership | Percentage of riders who transfer Increase in number of daily riders Increase in person-miles of travel |
| 2. 3. | Mobility Accessibility | Travel time savings Accessibility (general) | Hours of time saved (work/nonwork) Population within feet of transit stop |
| 4. | System Development, | Accessibility (transit dependent) | Jobs within feet of transit stop Population within feet of transit stop Services within feet of transit stop |
| , | Coordination and Integration | Feeder bus system Latermodal linkages | |
| 5. | Land Use | Impact on development | Barriers to development Change in accessibility Resulting change in development patterns |
| | | Community support Consequences of development Loint development apportunities | Supportive land use policies Environmental, fiscal |
| 6. | Freight | Railroad Trucking | Underdeveloped acreage within feet of transit stop Impact on freight movements Impact on deliveries |

Note: 1No specific set of critoria is required by the FTA. This list is typical of studies.

| Ger | ieral Category | Criteria | Measures | | | | |
|------|------------------------|------------------------------|--|--|--|--|--|
| 7. | Socioeconomic | Economic development | Construction jobs created Operations jobs created Multiplier effects | | | | |
| | | Displacement and relocation | Number of residents affected Number of jobs affected | | | | |
| | | Neighborhood impacts | Cumulative impacts | | | | |
| | | Historic and cultural sites | Identification and review of sites | | | | |
| | | Parklands | · Identification and review of sites | | | | |
| 8. | Environmental | Air quality | Tons of emissions/day New violations of NAAQS Conformity with SIP | | | | |
| | | Noise and vibration | Increase in noise levels Violations of noise standards | | | | |
| | | Ecosystems | | | | | |
| | | Water | , | | | | |
| | | Visual | | | | | |
| 9. | Energy | Energy conservation | BTUs for construction and operations Payback period | | | | |
| 10. | Safety and Security | Auto accidents | Number of accidents prevented | | | | |
| | | Security | · | | | | |
| 11. | Equity | Who pays? Who benefits? | Farebox recovery ratio Subsidy per trip | | | | |
| 12. | Costs | Capital costs | Dollars | | | | |
| | , | O&M costs | Dollars/year | | | | |
| 12a. | Efficiency | Cost-effectiveness | Added cost/new rider Added cost/hour of time savings | | | | |
| | | Operating efficiency | Change in O&M cost per passenger | | | | |
| 13. | Financial Arrangements | Local share of capital costs | Percentage of capital cost | | | | |
| | | Capital finance plan | Soundness | | | | |
| | | O&M finance plan | Stability and reliability Farebox recovery ratio Subsidy per trip | | | | |
| 14. | Institutional Factors | Community support | Financial commitments | | | | |
| (. | Other | Trade-offs summary | Supporting land use and transportation policies | | | | |

| Fort Worth | 36 | 676,944 | 1,919 | 1,70æ | | | | |

Residential construction has stressed multi-unit buildings and closely spaced, single unit housing development. Levels of income and auto ownership lower than in cities in the continental U.S. have forced the San Juan area to retain its high density structure during a period in which continental cities were undergoing a sudden, large-scale decentralization.

Figure II-7 shows 1970 population densities throughout the study area.

Population of Multicenters — Table II-6 shows the population in each of the six major multicenters. Together the centers contain approximately 15 percent of the area population.

Income — According to U.S. Census data, median family income for urban areas of the U.S. in 1969 was about \$15,000 (in 1975 dollars), considerably above the median family income in San Juan of \$6,750. However, between 1959 and 1969, income in real terms grew significantly faster in Puerto Rico (4.5 percent annually) than on the mainland (2.8 percent). Even so, in 1969, over 40 percent of the families in the SJMA were still below the official poverty line. This constrasts with only 8.5 percent in the U.S.

Quality of Transportation Service

Accessibility Indices — Direct access to transit service in a protected or exclusive right-of-way increases its attractiveness to potential users. This section measures the number of people and jobs within 2,000 feet of such ROW's, giving special consideration to low-income, elderly, and female groups. Table VI-16 contains the results.

Table VI-16. Measures of Accessibility to Major Facilities

| | RR | ·NS | LA- | NS | AR- | ac. | LA | ·BC | IA | .8 | Į. | В |
|----------------------------------|-------------------------------|-----------------------------|-------------------------------|-----------------------------|-------------------------------|-----------------------------|-------------------------------|-----------------------------|-------------------------------|-----------------------------|-------------------------------|-----------------------------|

| Population | | | | | | | | | | | | |
| • 1970 | 84.959 | 10 | 84.959 | 10 | 122.878 | 14 | 119,393 | 13 | 139.842 | 16 | 68,778 | 8 |
| • 1990 | 107,299 | 7 | 107,299 | 7 | 167.800 | 11 | 164,075 | 11 | 158,264 | 10 | 74,457 | 5 |
| Employment | | | | | | | | | | | | |
| • 1970 | 81,749 | 28 | 81,749 | 28 | 98,072 | 33 | 95,550 | - 32 | 123,147 | 41 | 80.156 | 27 |
| • 1990 | 121,019 | 22 | 121,019 | 22 | 143.258 | 27 | 135.061 | 25 | 210,143 | 39 | 125,909 | 23 |
| Below Poverty Level (1970) | 33,610 | 8 | 33,610 | 8 | 50.314 | 13 | 48,597 | 12 | 62,046 | 16 | 30.691 | 8 |
| 65 Years or Older (1970) | 8,009 | 15 | 8.009 | 15 | 10,441 | - 20 | 10,199 | 19 | 12.661 | 24 | 7,371 | 14 |
| Female (1970) | 44,421 | 10 | 44,421 | 10 | 63.965 | 15 | 62,127 | 14 | 73.524 | 17 | 36.261 | 8 |

The BC alignment compares quite favorably to NS in all categories. In both 1970 and 1990, BC directly serves slightly more than 10 percent of the population of the study area. Both alignments serve the Spine, which contains a major proportion of the employment in the study area. The percentage of employment directly served is quite high: about 25 percent for NS and almost 30 percent for BC. The two alignments also serve a substantial number of the transportation disadvantaged, with BC again comparing favorably to NS.

In all categories but population served, IB is equivalent to the NS alignment. Because of its greater coverage, IAB is clearly better than the other five alternatives, but it should be remembered that the level of service in the IAB is lower than that provided by the rail alternatives.

Ease of Use

All stations on the four rail increments will be designed to allow access to the system for the elderly and handicapped. The four rail systems rank "high" in ease

of use, with the two light rail systems being perhaps slightly inferior in this regard than the two rapid rail alternatives. The IAB system must be ranked "moderate" to "low" because of the difficulty a handicapped or elderly person can experience when attempting to board a bus. IB is ranked "low."

Safety and Reliability

The light rail and rapid rail alternatives will be about equal in safety and reliability because the light rail alignments have almost no non-grade-separated sections of guideway (see Table VI-17). Only on the sections between Nevarez and Centro Medico Stations and between Centro Medico and the 65th Infantry ROW does light rail operate at-grade in non-grade-separated guideways.

Table VI-17. System Safety

The IAB provides a somewhat lower level of safety and reliability because virtually none of its route mileage is on grade-separated bus facilities.

All five alternatives are safer and more reliable than the Improved Bus, which does not benefit from any new, protected rights-of-way.

Passenger Comfort

As with safety and reliability levels, significant differences in passenger comfort exist only between the bus and rail systems. Although ride quality and station design standards are a bit lower in light rail alternatives, differences between light and rapid rail alternatives are minimal (see Table VI-18).

Table VI-18. Measures of Passenger Comfort

| • | - cooning Connoc | | | | | | |
|--|-----------------------|-----------------------|-----------------------|-----------------------|------------------------|-----------------------|--|

| Ride Quality • Accel/Decel Rates (mphps) • Guideway Mileage Between Stations • Subjective Rating | 3/3 .74 High | 3/3 .60 High | 3/3 .93 High | 3/3 .65 High | N/A N/A Moderate | N/A N/A | |
| Station Design Stations with High Platforms Stations with Low Platforms N/A — Not applicable. | 14 | 11 6 | 16 | 13 | 0 | Low 0 9 | |

Both IAB and the Improved Bus have significantly lower levels of passenger comfort than any of the rail systems, with IAB being somewhat of an improvement over IB.

Economic Effects

Economic effects have been calculated using the same methodology as was explained in Chapter IV. Table VI-19 contains the results. RR-BC is clearly the best in this category with a combined travel savings in 1990 of \$57 million compared with the North-South at \$40 million and the IAB at \$16 million.

Indirect Community Benefits — Each of the five initial increments requires some construction, which will generate employment. Since the rail alternatives involve considerably more construction, they will benefit the area more than will IAB (see Table VI-20).

Table VI-19. Economic Benefits (in millions of 1975 dollars)

Impacts on the Surrounding Community and Environment

Local Impacts of the Initial Increments — Table VI-21 contains a detailed discussion of the local impacts incurred by each alternative. The rail alternatives displace more residences and businesses than IAB.

Regional Impacts on Air Quality, Noise Levels, and Energy Consumption — There are few differences between the rail alternatives themselves but some significant differences do exist between bus and rail (see Tables \7-22 and \7-23).

Table VI-21. Impacts of the Initial Increments on the Surrounding Community and Environment

| Allernativ | Adjacent Land Use | 6 Displacements | Vioual Quality | Ol |
|-----------------------|----------------------|--|--|---|
| RR-NS and LR-NS | Serves a types. | II 132 residences, 114 businesses, 1 church, and court will be displaced | Construction: Impare | as tion would occur around staging areas in Santur and Rio Piedras. Most di ruption will be concentrate along the main section aerial structure between H to Rey and Rio Piedras. Nei ligible disruption should occur south of Centro Medical Goodese. |
| 22.00 | | e e | Operation: Slight impact could be felt along the mail aerial section and around stations. | O due to increase a sur |
| RR-BC and LR-BC | Serves all types. | tro Medico the following displacements will occur: 132 residences, 114 businesses, 1 church, and 1 court. About 25 squatters may be displaced from the segment of ROW between Centro Medico and Las Lomas station. | Construction: Underground sections in Santurce and Rio Piedras would cause little impact, except near staging areas. The aerial segment from Hato Rey to Rio Piedras would cause significant visual intrusion. The track section along the 65th Infantry ROW from Centro Medico to PR2 would have negligible impact. Because the rapid rail alignment loops around Bayamon using the 65th Infantry Connector and the Rio Hondo light rail alignment runs on an aerial structure along PR2 through Bayamon and will cause a significant amount of visual intrusion. Gandara Park will be adversely affected. Operation: Small impacts may be felt along aerial sections and around stations. | tion will occur around stag- ing areas in Santurce and Rio Piedras. Most disruption will be concentrated along the aerial structure between Hato Rey and Rio Piedras. Additional impacts will oc- cur in the light rail alterna- tive due to the aerial seg- ment through Bayamon. Gandara Park will be ad- versely affected: |
| | ypos. | primarily by the Rio Piedras busway. | Construction: Visual intru- sion will occur in Rio Piedras because of the con- struction of the new bus- way. Some intrusion will arise during the reconstruc- tion of PR3 for the exclusive lanes. | Construction: Disruption may occur along the Rio Piedras busway and PR3. Minimal amounts of disruption should occur elsewhere. |
| 18 S | arvas 211 h | , | may be felt near the Rio Piedras busway | Operation: Negligible |

Table VI-22. Impacts on Air Quality, Noise, and Energy Consumption in the Region

| | | Initial Asil | Alternatives | Initial Advanced Bu | e and Improved Bus |
|---------------------------|--------------|---|--|---|---|
| Calegory | Phase | Impocto | Romarks | Impacte | Remarks |
| | Construction | Short-term adverse impacts on areas adjacent to construction sites, | Construction activities will generate vehicle emissions, amoke, and fugitive dust. Compared to the impacts of IAB, impacts for rail will affect more area for a longer time to a greater degree. | tA8 will have short-term, adverse impacts on areas adjacent to construction sites | The Improved Bus involves no construction, so there will be no impacts. Construction activities for IAB will generate vehicle emissions, smoke, and fugitive dust |
| Alr Quality | Operation | There will be negligible adverse impacts on areas adjacent to rail stations and a positive impact on regional air quality | Pollutants produced in the area should be significantly below the level produced if the Improved Bus is implemented. | IAB will have a positive impact, except in specific areas where bus operations increase significantly. | Because patronage for IAS will be significantly higher than for the improved Bus, air quality should be somewhat improved. Buses generate more pollution than do rail vehicles, so the improvement will be greater for the initial rail systems than for IAS. |
| | Construction | Short-term adverse impacts on areas adjacent to construction sites. | Potential sources of noise are truck movements, drilling, excavation, compacting, etc. | IAB will have short-term negative impacts on areas adjacent to construction sites | IAB will generate noise to a lesser degree than the rail increments. Maximum impacts will occur along the Rio Piedras busway and the |
| Noise and Vibration | Operation | Adverse impact on areas directly adjacent to aerial and at-grade tracks. | Principal noise sources are the propulsion system, auxiliary equipment, and wheel/rail interaction. Constant maintenance of wheel and rail surfaces and use of noise barriers can reduce wayside noise levels. The use of tunnels through Santurce and Rio Piodras and the reduction of bus movements along the Spine should cause some reduction in noise levels. | Both IB and IAB will have small adverse impacts on station areas. | exclusive lanes on PR3. |
| Energy | Construction | Minimal impact. | The rail alternatives will require more energy for construction than IAB, but careful scheduling and other measures can reduce the amount of energy needed. | IAB will have minimal impact | |
| | Operation | Positive impact. | Regional transportation en- ergy consumption should be somewhat reduced due to the shifting of auto (rips to transit | IAB will have a positive im- pact, but it will be smaller than the impact of the rail alternatives | |

Air quality should experience a greater improvement if a rail system is built. Small mobile sources are more difficult to control than are fixed sources like power plants. Significant improvements can be made by switching from gasoline-powered to electrically-powered vehicles.

Noise levels should be higher for the rail during construction but significant improvements may be experienced in those sections of the Spine where vehicles operate underground.

Energy consumption should be reduced by the rail systems and IAB because of the magnitude of the shift of trips from auto to transit for all five alternatives.

Patterns of Urbanization and Growth

In terms of impact on patans as of urbanization and growth, the six systems can be ranked accordingly:

- RR-BC and LR-BC
- RR-NS and LR-NS
- IAB
- Improved Bus
